

# Release Notes: LARA 1.2.0b40

This is an interim version with minor functional changes and quick bug fixes.

The purpose of this document is to provide updates, bug fixes, and tips for LARA recent release.

## What's new in 1.2.0b40

- ISC-2088: The LARA Help function has been redesigned. When you press the help button, a QR code and a link will be displayed. You can always access the latest user manual by clicking on the link or scanning the QR code with your mobile phone.
- ISC-2081: For Cisco modules, you can edit and save the factory default "ciscoConnectionTimeout" parameter.
- ISC-2046: If an older configuration file containing a module was uploaded, the parameters were not updated correctly in the module and instances. This has been fixed.

## Hints

- You can also upload configurations and/or modules previously exported from the previous version. In this case, all modules of an older configuration must be upgraded one by one before you change anything. A pop-up message will automatically appear about this when uploading. Both automatic and manual updates are possible.
- A configuration saved from a newer version will be rejected by an older LARA (even if it would be unjustified because there are not that many changes) (API versions are not compatible)
- Rules can be disabled one by one at the driver level (module, not at the instance level) and re-enabled from the interface.
- Session Management - Timeout: In case of inactivity, the user is logged out after 30 minutes, which can be extended by a pop-up message 5 minutes before the expiration date. The extension only renews the inactivity time, it does not extend the 120-minute absolute expiration time
- It is recommended to erase your browser's cache at the first use of the firmware or LARA. Without erasing the cache the browser may use the previous (cached) version of some GUI pages, without the functions to launch LARA from web-LDC.
- If the configuration download does not work, please enable pop-up windows.
- If you do not find a cancel button, please click next to the pop-up window and it will cancel and close.
